RADIOLOGY REPORT - CHEST X-RAY (PA VIEW)

Patient Name:	Fahad Iqbal	Patient ID:	RX-77321
Age / Sex:	45 / Male	Referring Physician:	Dr. Omar Farooq
Exam Date:	2026-07-05	Report Date:	2026-07-05

Clinical History: Persistent cough and low-grade fever for 2 weeks.

Technique: Single frontal (PA) view of the chest was obtained.

Findings:

The lungs are mildly hyperinflated. There is patchy airspace opacity in the right lower lobe, suspicious for consolidation. No pleural effusion is identified. The cardiac silhouette is within normal limits. The mediastinal contours are unremarkable. No pneumothorax is seen. Visualized osseous structures show no acute abnormality.

Impression:

- Right lower lobe consolidation, likely representing pneumonia; clinical correlation recommended.
- No pleural effusion or pneumothorax.
- Normal cardiac size.

This report is a synthetic test document and does not represent a real patient.
